

Task-I Use case diagram reaction

Objective: Create a simple use-case diagram For a Library mangement System.

Steps to Perform

1. Identify Actors :

- Think about the people or systems interacting with the Library Management System.

- Example Actors:

- Librarians (manage books and user accounts)

- Members (borrows and returns books)

2. Define use cases [Functionalities]

- List out what major tasks or services system provide those actors.

• Example Use Cases:

- Search catalog - Members searches for books
- Check out book - Member borrows a book.
- Return book - Member returns a borrowed book.
- Manage Inventory - Librarian updates book records, add/remove books.

3. Draw the Use-case diagram

- Place actors on either side of your drawing (stick figures or simple icons)
- Draw ellipses (ovals) to represent each use case (the systems action)
- Connect each actors to the use cases they interact with use straight lines.
- (Optional) Add the system boundary box if you want to show that the use cases belong to the system.

4. Review for completeness

- Double-check that every major user action is captured.
- Ensure connections are logical and clear - no actor should be left isolated.
